

Bloom Energy

On-Site Power Generation (solid-oxide fuel cells) · San Jose, CA · NYSE: BE (Q1'26 rev \$751M +130%; FY26 guide \$3.4-3.8B; ~\$20B backlog)

Bloom Energy - the 'bring-your-own-power' breakout of the AI-power crunch (Q1'26 revenue +130%, ~\$20B backlog, +219% YTD) - has never been in motorsport, and resilient on-site power is a real workstream for a team's energy-hungry factory, data centre and trackside.

THE CASE

Bloom Energy (NYSE: BE) is the breakout winner of the AI-driven 'bring-your-own-power' crunch: Q1'26 revenue rose 130% to \$751M (product revenue +208%), FY26 guidance is \$3.4-3.8B, backlog sits near \$20B, and the stock is up 219% YTD on data-centre power deals with Brookfield (\$5B), Oracle and a 328MW order from Nebius. Its solid-oxide fuel cells deliver clean-er, resilient on-site power where the grid can't keep up. It has never entered motorsport. On-profile (power/energy) and a real fit: a modern F1 operation - factory, wind tunnel, an energy-hungry CFD/compute data centre and trackside - needs resilient power, and on-site generation is exactly Bloom's domain. HONEST framing: fuel cells run on (lower-carbon, hydrogen-capable) natural gas, so this suits F1's hybrid/sustainable-fuel era rather than all-electric FE; and 'facility power' overlaps the Vertiv/Eaton theme, so brand_fit is scored down. Founder-CEO KR Sridhar.

WHY NOW

Bloom is at the crest of the AI-power demand cycle (record growth, a ~\$20B backlog, a stock up 219% YTD), so capital and brand visibility are peaking, and F1's energy-intensive 2026 era makes resilient on-site power on-message. The Nebius 328MW deal shows the 'power-behind-the-compute' thesis is live - move while the category is hot.

WHY WILLIAMS

Williams is a data-and-compute-led team (VAST, Anthropic) with energy-intensive simulation and an open on-site-power lane, so 'the power behind the compute that designs the car' is an on-narrative fit. The value is resilient, efficient on-site generation for the team's facilities and compute, not car technology.

VALUE TO WILLIAMS — MODE A (TECH IN THE CAR / CHAMPIONSHIP)

MODE A with real mechanics. (1) TECHNICAL (the core): an F1 team's factory, wind tunnel and (increasingly) its CFD/AI data centre are energy-intensive and cannot lose power - Bloom's on-site solid-oxide generation supplies resilient, efficient, lower-carbon power independent of grid constraints, a genuine, deployable workstream that gets more valuable as compute loads climb under the cost cap. (2) COMMERCIAL / B2B: Bloom sells to hyperscalers, manufacturers and data-centre operators who populate the F1 paddock (and it powers Nebius), so hospitality becomes a working channel, while Williams gains a fast-scaling energy anchor. (3) BRAND / TALENT: 'the power behind performance' ties Bloom to the AI-power era on a data-driven sport, with an energy/engineering talent halo. Williams gets resilient on-site power and a blue-chip anchor; Bloom gets a visible reference at its peak.

DEAL ARCHITECTURE

Official On-Site Power Partner on Williams, minimum three years, ~\$4-6M/yr, with category exclusivity in on-site power generation and a deployment powering the team's facilities, data centre and trackside operations.

PRIMARY DECISION-MAKER

KR Sridhar
FOUNDER, CHAIRMAN & CEO, BLOOM ENERGY - VERIFIED

Founder, chairman and CEO, who has built Bloom into the AI-power 'bring-your-own-power' leader - the owner of a strategic, brand-defining partnership and the entry point. Decision path: Sridhar (strategy/brand) with Bloom's commercial/marketing leadership as the activation counterpart; confirm the CMO/CCO before outreach.

OPENING ANGLE

"KR - F1 teams now run energy-hungry CFD and AI data centres that can't lose power, and 'bring-your-own-power' is exactly your moment. Williams is data-led with an open on-site-power lane - the power behind the compute that designs the car. 25 minutes?"

SCORE COMPOSITION

TIMING 18 / 20 Peak moment: Q1'26 revenue +130% to \$751M (product +208%), FY26 guidance \$3.4-3.8B, ~\$20B backlog and the stock +219% YTD on AI 'bring-your-own-power' demand (Brookfield \$5B, Oracle, Nebius 328MW).	CAPACITY 18 / 20 Multi-billion revenue trajectory and a ~\$20B backlog - ample for a top-tier partnership.	BRAND FIT 15 / 20 On-site power for energy-intensive operations is on-message in the AI-power era, but fuel cells run on (lower-carbon) gas - a mild optic for motorsport - and 'facility power' overlaps the Vertiv/Eaton theme, so not pristine.	URGENCY 14 / 20 The 'bring-your-own-power' land-grab and F1's energy-intensive 2026 era create momentum, but no single dated F1 trigger.	OPS FIT 15 / 20 MODE A: resilient on-site power generation for a team's factory, CFD/compute data centre and trackside - genuinely deployable, especially as compute/energy loads climb under the cost cap.
--	--	--	--	---

RISKS & COUNTERS

GAS OPTIC FOR MOTORSPORT Solid-oxide fuel cells run on natural gas, which sits awkwardly against a sustainability-forward sport. **Counter:** Position for F1's hybrid/sustainable-fuel era (not all-electric FE), emphasise lower-carbon, resilient, hydrogen-capable on-site power and measurable efficiency - not zero-carbon claims.

OVERLAPS THE FACILITY-POWER THEME Power-for-facilities is adjacent to Vertiv (power+cooling) and Eaton (electrical). **Counter:** Bloom's lane is on-site GENERATION (vs distribution/cooling) - a distinct category; position precisely and on a different team (Williams).

LARGE-CAP, MANY PRIORITIES At peak demand Bloom may not prioritise one team. **Counter:** Frame as a flagship 'power-behind-the-compute' reference (it already powers Nebius) and a B2B-pipeline channel, right-sized to a real deployment.
