

Fairmat

Recycled Carbon Fibre / Sustainable Composites · Paris, France · Private (EUR51.5M Series B, Apr 2025; ~\$114M raised; recycled carbon fibre)

Fairmat - the French deep-tech turning carbon-fibre waste into new structural composite (FairPly) - has never been in motorsport, and for a team that builds its own carbon-fibre F1 car it is a real, two-way sustainability-and-materials partnership, not a logo.

THE CASE

Fairmat (Paris, founded 2020) uses a patented cold-atmospheric-plasma process to recycle aerospace and wind carbon-fibre waste into FairPly, a new structural composite - closing the loop on a material that is otherwise landfilled or burned. It raised a EUR51.5M Series B in Apr 2025 (EUR26.5M equity + EUR25M EIB venture debt; Bpifrance and Slate VC leading, with Temasek, Pictet, Singular, CNP and Infinity Recycling), ~\$114M in total, and already sells to Hexcel, Siemens Gamesa and sports brands (Decathlon, DPS Skis). It has never touched motorsport. The fit is with F1, not FE, for a concrete reason: FE uses a spec chassis (Spark builds the common monocoque for all teams), so recycled composite there is a championship-level choice - whereas an F1 constructor designs and manufactures its OWN carbon-fibre car (~85% of it composite), so Fairmat is a genuine team-level materials workstream and a direct lever on F1's Net Zero 2030 pledge. HONEST framing: near-term use is non-structural/bodywork, garage and facility composites plus verified sustainability data, co-developing toward structural parts (homologation makes fully-structural longer-dated) - so it is a WARM, real-but-scaling MODE-A. Decision-maker: Founder & CEO Benjamin Saada.

WHY NOW

F1's Net Zero 2030 commitment and the cost cap are pushing teams toward sustainable, lower-cost materials now, and Fairmat is scaling post-Series-B with FairPly in commercial demand - so a founding materials relationship is best built early, before a rival team or composite brand claims the 'recycled carbon fibre' position. The honest why-now is positional, not a dated trigger.

BOTTOM LINE

The French deep-tech recycling carbon-fibre waste into new structural composite (FairPly, via a patented cold-plasma process) - EUR51.5M Series B (Apr 2025; incl. EUR25M EIB), ~\$114M raised, backers Bpifrance/Temasek/Pictet. WHY F1 NOT FE: FE runs a spec chassis (Spark builds the common monocoque), so recycled composite there is a championship decision, not a team one - but F1 teams design and build their OWN carbon-fibre cars (~85% composite), so it's a real team workstream + a direct Net-Zero-2030 lever. Two-way exchange, not a logo. Founder-CEO Benjamin Saada.

DISCOVERY: SELF

WHY WILLIAMS

Williams is an engineering-revival constructor that designs and builds its own carbon-fibre car, with a materials/sustainability lane that is open (its Atlassian, VAST, Keeper and Anthropic deals are all non-materials), so a recycled-composite partner is a genuine engineering and Net-Zero story rather than a logo - and a right-sized, mutual innovation partnership for a midfield team using material smarts to punch up. No partner conflict (Fairmat's backers are diversified funds, none a Williams rival).

VALUE TO WILLIAMS — MODE A (TECH IN THE CAR / CHAMPIONSHIP)

A TWO-WAY exchange (tech + business both directions), not sponsorship cash - three concrete swaps. (1) MATERIAL <-> PROVING GROUND: Fairmat supplies FairPly recycled carbon fibre for the team's composite parts (bodywork, garage/transport and facility structures, co-developing toward more), cutting material cost and footprint; in return the F1 car - the most extreme structural test on earth - becomes Fairmat's ultimate performance validation and global reference, de-risking FairPly for its aerospace/auto buyers. (2) SUSTAINABILITY DATA <-> CREDIBILITY: Fairmat gives the team auditable recycled-content and CO2-avoided data that feeds its FIA / F1 Net-Zero-2030 reporting and a real (non-greenwash) circular-materials story; the team gives Fairmat a global sustainability-leadership stage and a marquee engineering brand association. (3) CO-ENGINEERING R&D <-> BUYER NETWORK: joint R&D subjecting recycled composite to F1 loads advances FairPly's spec and IP; the team's paddock and its OEM/aerospace ecosystem open exactly the industrial composite buyers (the Hexcel/Siemens-Gamesa world) Fairmat needs to scale. Williams gets cost-down sustainable material + a hard ESG story; Fairmat gets validation, a stage and buyers.

DEAL ARCHITECTURE

Official Sustainable-Materials / Recycled-Composite Partner on Williams, minimum three years, ~\$2-4M/yr (right-sized to a scale-up), structured as a co-development + material-supply workstream (non-structural and facility composites first, structural R&D roadmap) plus a joint Net-Zero-2030 sustainability-data and content programme - value exchanged both ways, not a pure logo fee.

PRIMARY DECISION-MAKER

Benjamin Saada
FOUNDER & CEO, FAIRMAT - VERIFIED

Founder and CEO of Fairmat, the owner of brand and strategic-partnership decisions and the entry point - a founder who has framed Fairmat around high-performance sustainable materials, for whom an F1 validation + buyer-access exchange is strategically valuable. Confirm the commercial/marketing lead before outreach.

OPENING ANGLE

"Benjamin - F1 cars are ~85% carbon fibre and the sport is committed to Net Zero 2030, but no one has claimed 'recycled carbon fibre' on the grid. Williams builds its own car and needs a material + sustainability edge; you need the ultimate proving ground and access to composite buyers. That's a two-way deal. 25 minutes?"

SCORE COMPOSITION

TIMING 15 / 20 EUR51.5M Series B (Apr 2025) plus the FairPly launch (Jan 2026) and JEC World 2026 - active capital and commercial momentum, though not a mega/IPO inflection.	CAPACITY 14 / 20 ~\$114M raised with Bpifrance, Temasek, Pictet and a EUR25M EIB loan, and a revenue-generating order book - deal-capable at a value tier, though it is a scale-up funding an industrialisation build (honest).	BRAND FIT 16 / 20 Recycled carbon fibre on a team-built F1 car is squarely on-message for F1's Net Zero 2030, a genuine engineering-material story, and the composites/materials lane is open across the grid.	URGENCY 13 / 20 F1's Net-Zero-2030 mandate and cost-cap material pressure make sustainable composites timely, but there is no single dated Fairmat-specific F1 trigger.	OPS FIT 15 / 20 MODE A: F1 constructors build their own carbon-fibre parts, so recycled composite is a real team workstream - near-term on non-structural bodywork, garage/transport and facility composites plus verified sustainability data, co-developing toward structural use (homologation makes fully-structural a longer road - scored honestly).

RISKS & COUNTERS

STRUCTURAL HOMOLOGATION IS LONGER-DATED Safety-critical F1 parts are homologated, so recycled composite won't go straight into the monocoque. **Counter:** Start on non-structural bodywork, garage/transport and facility composites plus the sustainability-data story, with a co-development roadmap toward structural use - scored MODE-A but honestly as scaling.

SCALE-UP CAPACITY Fairmat is a Series-B scale-up funding an industrialisation build, so budget is value-tier. **Counter:** Right-size to ~\$2-4M/yr framed as a co-development + validation partnership (value exchanged both ways), not a marquee logo fee; ~\$114M raised + EIB/Temasek confirm deal-capability at that level.

FE LOOKS LIKE THE 'GREENER' HOME One might assume Formula E is the natural fit for a sustainability material. **Counter:** FE's spec chassis (Spark) means recycled composite is a championship decision, not a team one; F1 constructors build their own cars, so the real team workstream - and the bigger composite volume - is in F1.
